1. Which of the following is not usually referred to as a “node” of a network?
   a. a computer
   b. the edge
   c. a router
   d. a host

2. A multicast must involve:
   a. Multiple destinations
   b. Multiple sources
   c. Multiple senders and receivers

3. A link over which data can be sent in either direction, but not simultaneously, is referred to as a ______________ link.

4. “16MB” refers to:
   a. $2^{27}$ bits
   b. $2^{20}$ bytes
   c. $16 \times 2^{13}$ bits
   d. $16 \times 10^8$ bits

5. “100Gbps” refers to:
   a. $10^{10}$ Bytes per second
   b. $10^{11}$ bits per second
   c. $100 \times 2^{30}$ bytes per second
   d. $100 \times 2^{30}$ bits per second

6. “PAN” is an acronym for ____________________________.

7. The “Postal Service Model” of communication that we discussed in class is an example of a:
   a. Circuit-switched model
   b. A datagram model
   c. A connection-oriented model
   d. None of these is correct

8. A protocol allows agreement on the _____________ and _____________ of messages.
9. Consider two layers in a multi-layer protocol stack, N and N+1. There is ________ interface between the layer N protocol at one node and the layer N+1 protocol at another node.
   a. a virtual
   b. a physical
   c. no direct
   d. None of the above is correct -- they are the same protocol.

10. A protocol layer in a multi-protocol stack:
    a. Encapsulates data received from the layer below
    b. Does not always use the same rules and formats that are used by peer protocols at the same layer
    c. Depends to a great extent on the detailed design of the layers below it.
    d. None of these is correct.

11. We refer to the Transport Layer of the ISO OSI model as L___. It manages ______-to-_______ transfers. The data unit is the _________________.

12. List the layers of the ISO OSI model, starting with L1.

13. In the TCP/IP Reference model, the OSI Network Layer corresponds to:
    a. IP
    b. TCP
    c. UDP
    d. There is no Network Layer in the TCP/IP model

14. What is the highest-numbered OSI protocol layer that would normally be found on a network router?
    a. L7
    b. L4
    c. L3
    d. L2

15. A server in a client-server system would normally be expected to execute a:
    a. Blind socket open
    b. Active socket open
    c. Passive socket open
    d. Permissive socket open
16. Which of the following is NOT an element of reliable network communication, as we discussed it in class:
   a. Data received on time
   b. All data received
   c. Data received in order
   d. All of these were discussed as elements of reliable network communication

17. To have a reliable network:
   a. All protocol layers must be reliable.
   b. Some protocol layers can be unreliable as long as there is a reliable protocol at a higher level of the protocol stack.
   c. Some protocol layers can be unreliable as long as there is a reliable protocol at a lower level of the protocol stack.
   d. All protocol layers must be best effort.

18. The latency of a fiber link is 0.5 sec. Its length is:
   a. 115Km
   b. 150Km
   c. 100Km
   d. None of these

19. Bits are being streamed onto a particular link. The link can accept a new bit every 20 nsec. The link’s bandwidth is:
   a. 100Mbps
   b. 50Mbps
   c. 20Mbps
   d. 10Mbps

20. Which would be better suited for an environment where there is a large amount of electrical noise,
   a. Twisted Pair
   b. coaxial cable

21. Which of the following did we NOT discuss for use in a “last-mile link”? 
   a. FSK
   b. CSU/DSU
   c. T1
   d. ISDN

22. A modem provides a rate of 1Kbps. You would expect the baud rate of this modem to be:
   a. Less than 1000 signals per second
   b. Equal to 1000 signals per second
   c. Greater than 1000 signals per second

23. Nyquist’s Theorem states:
   a. The optimum sampling rate for a signal is half the highest frequency in the signal.
   b. The optimum sampling rate for a signal is equal to the highest frequency in the signal.
   c. Neither of these
24. Fixed-slot TDM is used on a particular link. This means that if there are \( n \) channels supported by the link, the effective bandwidth that each channel gets is:
   a. \( \frac{1}{n} \) of the total bandwidth, continuously
   b. The total bandwidth, \( \frac{1}{n} \) of the time
   c. (a) and (b) mean the same thing

25. Name the sublayers of L2 and briefly describe the difference between their purpose.

26. You would be more likely to see “byte stuffing” used in a frame format that also uses:
   a. Byte counts
   b. Bit-stuffing
   c. Clock-based framing
   d. Sentinels

27. A T1 frame must be sent each 125 usec. This means a T3 frame must be sent each:
   a. 41.7 usec
   b. 3.5 msec
   c. 4.5 usec
   d. None of these is correct

28. Which of the following is an error-correction method?
   a. Byte counts
   b. Sampling
   c. CRC
   d. None of these

29. When we analyzed the LLC algorithm that we called “Simplex + Acknowledgements”, we found that the algorithm deadlocks. What did we add to prevent deadlock?
   a. Timeouts
   b. Sequence numbers
   c. Sliding window
   d. Byte counts

30. Which of the following is used by the Stop-And-Wait ARQ protocol?
   a. Acknowledgements
   b. Timeouts
   c. “Last Flag” or sequence number
   d. (a), (b), and (c)
   e. (a) and (b), but not (c)
   f. (a) and (c), but not (b)

31. Which of the following statements most accurately describes the Go-Back-N protocol?
   a. It is efficient
   b. It is not efficient
   c. It is efficient for links that have low error rates
   d. It is efficient when a link has a high error rate
32. Briefly explain Implicit Acknowledgement as used in the Sliding Window Algorithm.

33. If we call an Ethernet “10BaseT”, we are implying:
   a. It has a bandwidth of 10Kbps and runs on optical fiber
   b. It has a bandwidth of 10Kbps and runs on twisted pair copper
   c. It has a bandwidth of 10Kbps and the type of link is not specified
   d. None of these is correct

34. Briefly explain what “CS” and “CD” mean in “CSMA/CD”. It is not acceptable to simply state what the acronyms stand for.

35. Which of the following is not a field in all Ethernet frames?
   a. Source address
   b. CRC
   c. Pad
   d. Type/Size

36. Which of the following could be an Ethernet MAC address?
   a. “250.76.4.4”
   c. “04:A2:11:F6”
   d. “250,76.4”

37. An Ethernet frame carries 12 bytes of data. What is the length of the frame, excluding the Preamble?
   a. 30 bytes
   b. 46 bytes
   c. 64 bytes
   d. 128 bytes

38. In Ethernet, the concept of the “longest collision” is most closely related to:
   a. The maximum physical length and slot time
   b. The number of cycles in the exponential backoff algorithm
   c. The maximum number of nodes that can be connected
   d. Promiscuous mode and broadcasting
39. Assume there has been a collision on an Ethernet. The probability of the collision repeating after only one cycle of the exponential backoff algorithm is:
   a. Almost 1.0
   b. 0.75
   c. 0.5
   d. 0.25

40. What standard governs the design of Token Ring LANs?
   a. ISO 802.3
   b. ISO 802.5
   c. IEEE 802.3
   d. IEEE 802.5

41. A FDDI ring can operate after:
   a. One link fails
   b. Two links fail anywhere
   c. Two links in different rings fail
   d. Any number of links fail

42. The equipment that connects subnets at the Network Layer is called a:
   a. Bridge
   b. Router
   c. Channel
   d. Subnetwork connector

43. Briefly explain how a learning bridge “learns” which port to send frames to, and how it is kept up-to-date.

44. Perlman’s algorithm:
   a. Helps determine where to place bridges
   b. Breaks loops in bridged LANs
   c. Both (a) and (b) are correct
   d. Neither (a) nor (b) is correct

45. Name and briefly explain the difference between the two primary functions of a router.
46. Briefly explain the difference between a blocking and non-blocking switch fabric.

47. In a connectionless network, a router’s Routing Table specifies:
   a. The address of the next router in the path to the destination
   b. The virtual circuits that pass through the router
   c. Input ports that data will be accepted through
   d. None of these is correct

48. TCP/IP:
   a. Supports both connection-oriented and connectionless paradigms
   b. Sends and receives **all** data using packet switching
   c. Provides no packet-switching construct to the user
   d. (a) and (b) are true, but not (c)
   e. (b) and (c) are true, but not (a)
   f. (a) and (c) are true, but not (b)

49. Two devices on an Ethernet, device A and device B, experience a collision. They run the exponential backoff algorithm and experience a second collision. What is the probability that A and B will collide on their next attempt?
   a. 1/8
   b. 1/4
   c. 1/2
   d. 1

50. Briefly explain the difference between a blocking and non-blocking socket call.
